## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 1\_CY

Attempt : 1

Total Mark : 40

Marks Obtained : 40

### **Section 1 : Coding**

#### **1. PROBLEM STATEMENT:**

Jule a mathematician expert is given two integers to find if the second integer is above the average of the first and second integer. Write a program that achieves this using the ternary operator.

#### ***Input Format***

The first line of input represents the first integer.

The second line of input represents the second integer.

#### ***Output Format***

The output should be displayed as "Below Average" or "Above Average"

REFER THE SAMPLE TESTCASES FOR THE FORMAT SPECIFICATIONS.

**Sample Test Case**

Input: 1

1

Output: Below Average

**Answer**

```
import java.util.Scanner;
class main{
    public static void main(String[] args){
        Scanner sc =new Scanner(System.in);
        int a=sc.nextInt();
        int b=sc.nextInt();
        if(a<b){
            System.out.println("Above Average");

        }
        else{

            System.out.println("Below Average");
        }
    }
}
```

**Status :** Correct

**Marks :** 10/10

**2. Problem Statement**

Mandy is working on a cybersecurity project that involves basic encryption techniques. She wants to write a program that takes an integer number and performs a bitwise XOR operation to flip all the bits.

Help Mandy in this encryption using bitwise operations.

***Input Format***

The input consists of an integer N, representing the number to be flipped.

### **Output Format**

The output displays "Result: " followed by an integer representing the result of the bitwise XOR operation to flip all the bits.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 0

Output: Result: 255

### **Answer**

```
import java.util.Scanner;
class main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int a = sc.nextInt();
        System.out.println("Result: "+(a^255));
    }
}
```

**Status : Correct**

**Marks : 10/10**

### **3. Problem Statement**

In a logistics company, each delivery pack contains a specific number of items, and the priority customer receives double the amount. Write a program to determine the total number of delivery packs required for the operation, considering the number of items per pack and the number of customers given as input by the user.

### **Example**

Input:

Number of items per pack = 96

Number of customers = 8

**Output:**

10

**Explanation:**

Given the number of items per pack = 96 and the number of customers = 8, the calculations are as follows:

Total number of items needed = number of items per pack \* number of customers =  $96 * 8 = 768$ . Priority customer's share = double the amount of items per pack =  $2 * 96 = 192$ . Total items with the priority customer = total items needed + priority share =  $768 + 192 = 960$ . Number of packs needed =  $(960 + 96 - 1) / 96 = 10.98$ . Since we cannot have a fraction of a pack, the output is 10.

#### ***Input Format***

The input consists of two space-separated integers N and C, representing the number of items per pack and the number of customers.

#### ***Output Format***

The output displays an integer, representing the total number of delivery packs required for the operation.

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 1 1

Output: 3

#### ***Answer***

```
import java.util.Scanner;
class main{
    public static void main(String[] args){
        Scanner sc = new Scanner(System.in);
        int n=sc.nextInt();
        int c=sc.nextInt();
        int t=n*c;
        int p=2*n;
```

```
    int tp=t+p;
    int b=(tp+n-1)/n;
    System.out.println(b);
}
}
```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement:

Tom is tasked with writing a program that determines whether a given integer is the square of another integer. A perfect square is a number that can be expressed as the square of an integer. The program should take an integer as input and determine if it is a perfect square or not.

The task is to implement the logic to check if the provided integer is the square of an integer and return the result.

##### ***Input Format***

The first line of the input contains an integer, "input", where |input| represents the absolute value of the integer.

##### ***Output Format***

The output should display a boolean value, "result," which should be set to true if the input is a perfect square (the square of an integer), and false if it is not.

Refer to the sample output for formatting specifications.

##### ***Sample Test Case***

Input: 16

Output: Is the integer a perfect square? true

##### ***Answer***

```
import java.util.Scanner;
class main{
    public static void main(String[] args){
```

```
Scanner sc = new Scanner(System.in);
int a =sc.nextInt();
double s=Math.sqrt(a);
boolean t=(s==(double)(int)s);
System.out.println("Is the integer a perfect square? "+t);
}
}
```

**Status : Correct**

**Marks : 10/10**
